MIDTERM DATASET APPROVAL PROPOSAL

TELCO CUSTOMER CHURN

1. SELECTED DATASET

Telco Customer Churn

- <https://www.kaggle.com/datasets/blastchar/telco-customer-churn>

This project will mainly focus on the prediction of the customer churns in the telecommunications area using the machine learning methods that we have learned.

The dataset will have data information of the telecommunication customers and the type of services that they have received, showing from the demographics and all the information and services they have gotten.

2. PROJECT OBJECTIVE

The objective of this project is to clean, explore, and preprocess the dataset and then use machine learning type of models to help the database using what we learned in the past labs.

- Being able to accurately predict the churn to identify the customers who could leave and grow some retention for the customers information.

- Contracts
- Billing informations
- Accounts

- Target = churn

Seeing the dataset, it has categories and numerical values that could be used in a machine learning problem, but also can implement class balancing, scaling, and even encoding. There could be possibly more methods since machine learning has many possibilities.

Along with this comparing into the real world there will always be some sort of customer retention problems in the business field that can be affecting in any dataset.
